

Unicorns

This dataset is about the elusive unicorns. They live in family groups. The dataset details the individual identity, the date of capture (in days since January 1st), the litter size (in number of foals), size (in m, height at the withers), hornlength (in m), bodymass (in tons). They also have oddly glizzering ornaments – galled “glizz” – some have more than others.

Unicorns also have three genders – female, male and undecided. Have fun exploring this dataset – but before you set out to do that – ask specific hypotheses for you to test in it!
